

## Visions FAQ

- Q:** *What is Visions?*  
**A:** Visions is a high quality full-height movable wall system manufactured by Environmental Wall Systems that provides cost-effective, customized glass panel office fronts as an alternative to traditional construction. Visions panels function like fixed walls, yet are movable and reusable. Panels installed for one office configuration may be taken down and reconfigured with no damage to the building and 100% reuse of materials. Visions provides a wide range of benefits to our clients including flexibility, solid return on investment (ROI), and virtually unlimited design options to meet every budget.
- Q:** *Where can Visions be used?*  
**A:** Visions is designed for use for office fronts in commercial buildings including corporate, educational, government, and retail applications. Visions is designed primarily for floor to ceiling offices and conference rooms. Visions is not designed for residential use.
- Q:** *How is Visions installed?*  
**A:** For detailed installation instructions, please click [here](#) to link to our installation video. As an overview, in most settings, the Visions ceiling track fastens to the ceiling grid with a non-marring grid fastener. Installers plumb down from the ceiling track to the floor and install a floor track, which is fixed in place by carpet grippers or double-sided tape. Panels are installed into the ceiling track and onto the floor track, then are locked together by a reusable feature strip that secures the panels in place. A reusable base trim snaps onto the floor track to complete the wall portion of the installation. Note that Visions can accommodate any ceiling type including drywall ceiling or open ceilings.
- Q:** *Can the panels be easily knocked out of place?*  
**A:** No. Visions is a fixed wall that when properly installed, will perform comparably with drywall in terms of strength and sturdiness. Extreme force would be required to knock a panel out of place.
- Q:** *Will the panels damage the ceiling grid?*  
**A:** No. The floor supports the panel weight, not the ceiling grid. The grid fastener utilizes a felt pad to prevent scratches to the ceiling grid. The Visions system is designed to eliminate or minimize any damage to the building.
- Q:** *Does Visions come with Door Units?*  
**A:** Yes. Environmental Wall Systems supplies door frames and doors as integral components of the Visions system. Visions offers both standard and custom door and frame options to our client's specifications.

7. **Q:** *How does Visions accommodate Electrical Outlets and Data Connections in the panels?*  
**A:** Visions typically features glass panel fronts with pre-wired (plug and play) UL approved systems mounted below the panels to the floor track. Visions offer customized solutions as the project demands. For more detailed information about Visions data and electrical options, please click [here](#).
8. **Q:** *What finishes are available on Visions panels?*  
**A:** Visions offers both standard and custom finishes to meet your design requirements. With Visions, your finish options are virtually unlimited ranging from standard and custom fabrics and vinyl wall coverings, to glass and powder coating options. Visions also features custom powder coat sublimation that allows us to apply virtually any print pattern, including various types of wood veneer patterns, to our glass framing components. Environmental Wall Systems will assist you in your finish selections or we will work with your project team in making your vision for your space a reality. To view our standard finishes, please click [here](#), or you may view our [photo gallery](#) for more ideas.
9. **Q:** *What is the height, width, and thickness of the panels?*  
**A:** Panels are manufactured in any height you require up to 12' and any width up to 60" for glass panels and up to 48" for solid panels. Each panel is 2 1/4" thick.
10. **Q:** *What if a panel does not fit?*  
**A:** Each panel is equipped with leveler legs that allow installers to adjust the height +/- 1-1/2". Panels can also be cut at the job site by a common circular saw to a non-standard width. The cut panel would then be installed where the system meets an existing wall.
11. **Q:** *How much more will I have to spend to purchase Visions?*  
**A:** Environmental Wall Systems' goal is to assist our clients in understanding how Visions can add significant value to their organizations. Historically and to the present day, traditional (fully unitized, full-height) movable walls are significantly more expensive on a first time cost basis, with the promise of the ROI coming at the back end once the walls are relocated.

With Visions, we also offer bottom-line value after the first move, but we also strive to make it affordable for clients on that first-time purchase. In many cases, in an apples-to-apples comparison, Visions will be competitive with drywall on a first-time cost basis. Then, when you factor in the hidden costs of drywall and conversely, all of the other advantages of our movable wall system, it is no wonder why our clients keep choosing Visions for their wall project needs.

12. **Q:** *What are the differences between IrisWall and Visions?*

**A:** IrisWall features a Class A fire rating, full furniture interface capability, a 40 STC sound rating, and a full range of customized options including custom doors and frames.

Visions is designed primarily as a glass panel office front system for buildings that make use of drywall stud walls for the cross runs or office divisions. Visions reduces the waste, time and cost for glazing contractors to create custom office fronts, all while offering impressive design options and greening the office environment with high-recycled content and reusability.
